roundtable

Health Sector

Wednesday 10 July
11.30 – 13.30

You are invited to our virtual event, bringing together people from within the health system who are ready to prepare for the impacts of climate instability.

[BOOK HERE](#)

The health system suffers from a double-edged sword of climate impacts: increased population health issues from local climatic change and severe weather events, while wider global symptoms will cause delivery disruptions from extreme weather events, supply chain breakdown and global climate driven migration.

Some indicative discussion points are:

1. How effective are the current governance processes for understanding and managing climate risk?
2. What direct risks are you currently preparing for? What are the next few novel climate risks you anticipate and how will you prepare for them?
3. What novel local and global cascade impacts should you plan for as a consequence of increased exceptional weather events?
4. How should your organisation's operating environment change, and what advocacy do you need to undertake? What do you need to know, and from whom, in order to undertake a robust risk assessment?
